PrajaDhvani — AI Civic Voice

B2 · Problem Statement

150 WORDS MAX

Every year, millions of Indians face broken roads, water shortages, and power failures with no real way to be heard. India has 121 languages spoken by over 10,000 people each, and only about a third of the population is proficient in English (Census of India, 2011). Yet national grievance systems like CPGRAMS remain text-heavy, English-first, and centrally administered, with the Department of Administrative Reforms and Public Grievances' own annual reports acknowledging chronic backlogs and weak grassroots visibility. Roughly 65% of Indians live in rural areas (Census of India, 2011) where low literacy and limited English shut people out of reporting altogether. Elected representatives receive the same complaints repeatedly, with no way to see which problems recur, how severely, or what fixing them would cost — so real, recurring problems stay invisible, unprioritized, and unresolved.

B3 • Target Audience

100 WORDS MAX

PrajaDhvani serves everyday citizens across Indian Lok Sabha constituencies — especially rural and semi-urban residents, elderly citizens, and anyone who cannot comfortably read, write, or type in English. Voice and photo reporting remove literacy as a barrier entirely. It equally serves Members of Parliament and local officials, who today receive scattered, unstructured complaints with no way to see patterns, severity, or cost. Both groups share one gap: citizens have no easy way to be heard, and representatives have no reliable way to listen — across ten Indian languages and thousands of wards, every single day.

95 / 100 words

B4 • The Solution

50 WORDS MAX

PrajaDhvani lets citizens report civic issues by voice, text, or photo, in their own language — no literacy or English required. AI groups similar reports, diagnoses the root cause, drafts a costed solution, routes it to the right department, and publishes it on an anonymous public dashboard.

47 / 50 words

B5 • How It Works

250 WORDS MAX

PrajaDhvani is a Flutter app (Android and web) backed entirely by Google Cloud/Firebase — no dedicated servers or special hardware, running on any citizen's smartphone. A citizen picks voice, text, or photo and describes their issue in one of ten Indian languages, with no mandatory sign-up.

On submission, a Cloud Functions pipeline calls Google's Gemini AI to transcribe voice, translate it to English, caption photos, and classify theme and severity, while resolving the exact ward and constituency via geographic boundary matching. Similar reports auto-group into an "issue cluster" tracking total reporters, unique households affected, and weekly trend. Once a cluster crosses a report or severity threshold, four AI agents reason in sequence, each reading the previous one's work:

Every claim the Root-Cause agent makes must cite a real citizen report; the Solution agent proposes costed fixes using real Indian municipal cost benchmarks; the Routing agent matches the correct government department from a verified directory, never invented; the Report Compiler writes the final citizen card, mapped to UN Sustainable Development Goals. Outputs: a live public hotspot map and solution cards for citizens and press, plus a private prioritised ticket view and one-click AI-drafted PDF briefing for the elected official — turning noise into an accountable, trackable civic record.

Dataset Used

100 WORDS MAX

PrajaDhvani does not train on any pre-collected dataset — it reasons over live citizen reports as they arrive, so no historical complaints were scraped, purchased, or used to pre-train a biased model. Grounding data is limited to official government geography: ward and taluk administrative boundaries (KGIS/KSRSAC datasets) for accurate routing, and public population figures for realistic impact estimates. Every other data point originates from a citizen's own consenting report, tied only to a random ticket ID — never their identity — keeping the system fair across every region it serves.

90 / 100 words

B8 • Accessibility

100 WORDS MAX

Voice and photo modes mean citizens who cannot read or write, or are visually impaired, never need to type a single word. The app runs in ten Indian languages — Hindi, Bengali, Tamil, Telugu, Kannada, Malayalam, Marathi, Gujarati, Punjabi, and English — chosen once and remembered. It is completely free, requires no premium hardware beyond a basic smartphone, and citizens can start reporting anonymously without creating an account first, removing both a cost and a signup barrier for India's most under-served users.

82 / 100 words

B9 • Societal & Environmental Impact

50 WORDS MAX

Societally, PrajaDhvani gives every citizen a voice regardless of language or literacy, and gives officials evidence to act on instead of guessing.

Environmentally, AI analysis runs only at meaningful report thresholds, and the system runs on serverless cloud infrastructure, keeping compute and energy use minimal per issue resolved.

Ethics & Privacy

100 WORDS MAX

- ✓ No Aadhaar number ever stored — OCR reads it once, then discards the image.
- ✓ Public dashboard shows only a ticket ID, an AI-scrubbed summary, and a ~300m-blurred location.
- ✓ Reporter counts use salted one-way hashes, never raw user IDs.
- ✓ Every AI root-cause claim must cite a real report or is rejected in code.
- ✓ Government contacts come from a verified table — never AI-invented.
