SEVA FIRST INNOVATION CHALLENGE | BUSINESS AND GOVERNANCE

Prajadhwani

India's public rail for civic voice

A business and governance concept report: market, pricing, financials, Digital India alignment, impact and expansion

Report details	
Prepared by	[Team name], [Team lead name], [Email], [Phone]
Date	November 2026
Status	Concept report. The product is built and tested; the pilot has not yet run. All forward-looking figures are estimates built on stated assumptions (Appendix A).
Live product	https://code-for-community-e2cf2.web.app

The answer in three lines

The problem. A citizen's civic complaint rarely reaches the right office, rarely in their own language, and almost never returns with a fix they have confirmed.

The answer. Prajadhwani is a multilingual civic-grievance rail: citizens speak, officials assign, workers fix, citizens confirm. It is built, tested and ready to pilot.

The ask. A pilot partner in government and about ₹3.5 crore of patient funding to reach break-even in year 4 and cover roughly 12 crore residents by year 5.

Executive summary

Civic voice is the one part of India's digital public infrastructure that is still missing, and Prajadhwani is ready to build it.

Situation

India has built world-class digital public infrastructure for money (UPI), identity (Aadhaar), documents (DigiLocker) and language (Bhashini). A citizen can pay anyone, prove who they are and carry their papers on a phone. But a citizen who reports a dead streetlight or a broken water line still enters a maze: which office, which form, which language, and who will tell them it is fixed.

Complication

Four breaks in the loop explain why grievance systems disappoint: citizens do not know which office to approach; forms and portals favour English; no named person owns a complaint; and 'closed' is declared by the department, not confirmed by the citizen. Officials suffer too: scattered channels, no single queue, no view of hotspots, and no way to show what they have fixed.

Resolution

Prajadhwani closes the loop. Citizens report by voice, text or photo in 10 Indian languages. The system suggests the right office and publishes an anonymised public report card naming the ward, MLA and MP. The area's officials assign a field worker; the worker fixes; the citizen confirms, with a fair 48-hour rule. An admin console groups similar issues across the state. The product is live on web and Android and has passed live end-to-end tests.

Exhibit 1 Prajadhwani at a glance (base case)

Dimension	Headline
Business model	Free for every citizen. Governments pay a per-resident subscription (about ₹1 to ₹2 per resident per year), plus one-time implementation fees, civic-insight subscriptions, assisted-filing fees and CSR grants.
Market	About ₹280 crore a year of direct software revenue pool across India; Prajadhwani targets 18.0 lakh reports a year across about 12 crore residents by year 5.
Financials (base case)	Revenue grows from ₹1.8 crore in year 2 to ₹19.4 crore in year 5. Operating surplus turns positive in year 4 and reaches ₹3.9 crore (20 percent) in year 5.
Funding need	Peak cash need of about ₹3.2 crore in year 4 (government payment delays included). We plan for ₹3.5 crore of patient capital.
Impact	Measured value of about ₹31.5 crore a year by year 5 from citizen and official time saved alone: about ₹2.1 of value for every ₹1 governments pay, before counting faster repairs.
Digital India fit	Built on Bhashini, designed to the Digital Personal Data Protection Act, 2023, sold through the Government e-Marketplace, and shaped as an open, interoperable rail rather than a closed app.
Evidence today	Working product on live infrastructure; 10 of 10 languages verified with Bhashini; 20 of 20 workflow checks and 18 of 18 photo-privacy checks passed on the real backend; 64 automated app tests. No real-citizen pilot yet.

So what

The product risk is largely retired. The remaining risks are commercial and institutional: winning a first government partner, and surviving government payment cycles. This report is built around those two risks.

Contents

1. The case for change: problem, stakes and why now
2. The solution and what makes it different
3. Market: who pays, and how big is the prize
4. Business model and pricing
5. Go-to-market: how we win the first and the hundredth customer
6. Financial outlook and funding need
7. Impact: what changes for citizens and for governance
8. Digital India alignment and the public-rail strategy
9. Expansion roadmap
10. Operating model, platform governance and team
11. Risks and how we manage them
12. The next 24 months and the 100-day plan
13. The ask and the use of funds

Appendix A: Assumptions | B: Scenario detail | C: Glossary | D: Notes on figures

1. The case for change

Every resident meets the broken loop; only the wrongly routed, English-only, never-confirmed complaint is the norm.

The problem, in four breaks

Exhibit 2 Where the complaint loop breaks today

Break	What happens	Who feels it	Prajadhwani response
Which office?	Responsibility is split across ward, taluk, district, city, state and central bodies. Citizens guess and are redirected.	Every citizen	Suggested office with official website and email, from a verified directory.
Which language?	Portals and forms are English-first or Hindi-first.	Non-English speakers, the elderly, rural citizens	Voice and text in 10 languages; text stays in the citizen's language.
Who owns it?	A ticket number in a queue; the MLA, MP and ward officer often do not see it.	Officials and elected representatives	Area-scoped dashboards; assignment to a named worker; public report card.
Is it fixed?	The department marks it closed. The citizen is rarely asked.	Every citizen who reported	Citizen confirms; 'not fixed' reopens; 48-hour rule.

Source: team analysis of grievance journeys; product design.

Why this is a governance problem, not only a service problem

- **Trust.** A complaint that disappears teaches citizens that the system does not listen.
- **Accountability.** Without a clear owner and a public record, no one can be held to a standard, and good officials get no credit.
- **Planning.** Governments plan blind when problems are not captured in a structured, geotagged, comparable form.
- **Inclusion.** The citizens with the most to gain from public services are the least able to use English-first, form-heavy channels.

Why now: five forces have converged

Exhibit 3 Enablers that did not exist together five years ago

Enabler	Why it matters for Prajadhwani
Bhashini and the National Language Translation Mission	Government-built speech recognition, translation and language detection for Indian languages, free to use. This removes the biggest barrier, language, at near-zero cost.
Smartphone and mobile data reach	Low-cost Android phones and cheap data make a voice-first app usable far beyond big cities.
Digital Personal Data Protection Act, 2023	A clear legal frame for consent, purpose and data minimisation, which Prajadhwani's privacy-by-design approach is built to satisfy.
Practical AI	Classification, clustering and routing that run cheaply; the model only chooses from a verified shortlist, so it assists without being trusted blindly.

Enabler	Why it matters for Prajadhwani
The public-infrastructure mindset	UPI, Aadhaar and DigiLocker have shown that shared rails beat one-off apps. Departments are ready to buy interoperable platforms.

So what

The need is universal, the technology is finally affordable, and the policy climate favours shared public rails. The gap is a product that treats the complaint as a loop to be closed.

2. The solution and what makes it different

Prajadhwani is a three-sided platform: citizens, officials and administrators share one record of every problem.

What is built today

Exhibit 4 The product, by user

User	What they can do today
Citizen	Report by voice, text or photo in 10 languages (a photo is required for problem reports). See the suggested office to approach. Get a token ID and a public report card. Browse a reports feed, say 'Me too', comment. Choose whether the photo is private, public with faces and plates blurred, or public with the whole photo blurred, after accepting privacy terms. Confirm whether a fix is real.
Official (MP, MLA, ward officer, Tahsildar, District Commissioner)	A six-tab dashboard for their own area: overview, reports, map, hotspots, emergencies, analytics. Assign reports to field workers, singly or in bulk. Open the original photo. AI briefing and PDF area report.
Field worker	A personal task list with the problem, place, note and photo. Start work, mark fixed, close tickets after the 48-hour window. Never sees who reported.
Administrator	Approve officials. See similar issues grouped by district, taluk, constituency, type, status and assignee. Find unassigned and ready-to-close tickets. Bulk assign and close.
The public	An open anonymised map and feed, per-report public cards, and a leaderboard of the share of reports fixed for MLAs and MPs.

Source: product as deployed, November 2026.

Competitive landscape

Prajadhwani does not compete with the idea of grievance redress; it improves on the way each existing option handles the loop. The options below are grouped by type; examples include national and state grievance portals, city civic apps, single-issue apps such as sanitation reporting, social-media complaints and telephone helplines.

Exhibit 5 How the alternatives compare on the four breaks (team assessment, to be validated in pilot)

Capability	Government portals	City or single-issue apps	Social media	Call centres	Prajadhwani
Voice and text in many Indian languages	Partial	Limited	Informal	Often yes	Yes (10)
Suggests the right office	Partial	Within one agency	No	By agent	Yes
Named owner and area-scoped queue	Departmental	Within one agency	No	No	Yes
Citizen confirms the fix	Rare	Rare	No	Rare	Yes
Public report card and leaderboard	Limited	Limited	Public but unstructured	No	Yes
Privacy-by-design public layer	Varies	Varies	Exposes the complainant	Not public	Yes
Works as a rail for other systems	Closed	Closed	No	No	Yes (planned API)

Source: team assessment of publicly known characteristics; categories, not named products. Treat as a hypothesis to test.

Five sources of difference

1. **Language stays language.** The citizen's words are never forced into English on their own screen.
2. **Citizen-confirmed closure.** The person who reported decides whether it is fixed.
3. **Deterministic routing.** AI ranks a shortlist; official contacts come only from a verified directory, so the system never invents an office.
4. **A privacy firewall.** Officials and the public work from an anonymised copy; identity stays in the private store; photos are private by default.
5. **Rail, not portal.** One back end that apps, WhatsApp, IVR and kiosks can all plug into.

3. Market: who pays, and how big is the prize

The direct software pool is modest; the value created and the strategic position as the rail are far larger.

Who pays

Citizens never pay. Revenue comes from the institutions that benefit from better information and a closed loop.

Buyer	Decision maker	Why they buy
Urban local bodies and city corporations	Commissioner, IT or e-governance head	Single queue, SLA tracking, proof of work, fewer duplicate complaints.
District administrations	District Commissioner	A district-wide view across departments; accountability to the state.
Taluk and ward offices	Tahsildar, ward officer	A simple work queue and a way to show fixes.
State governments	e-Governance, Urban Development, Rural Development and Panchayat Raj	A statewide rail and analytics; integration with existing grievance systems.
Elected representatives' offices	MLA, MP	Constituency picture; a fair public record. Included in the area contract.
CSR funders and philanthropies	CSR committees, foundations	Fund language access, outreach and assisted filing for underserved communities.
Planners and researchers	Departments, think tanks, universities	Anonymised, structured civic data (insights subscriptions).

Sizing the opportunity

Exhibit 6 Annual direct software revenue pool (₹ crore), at ₹2.0 per resident per year across the pool

Source: team estimate. ₹2.0 per resident is a pool-level planning price, higher than our year-5 blended price because early and small contracts price higher per resident. Population figures are rounded and approximate.

Reading the numbers honestly

- The direct software revenue pool, a few hundred crore rupees a year, is real but not enormous. We do not hide this.
- **The larger prizes are different.** If every resident were covered at 1.5 percent reports a year, the measured value of citizen and official time saved alone would be about ₹368 crore a year, before the value of faster repairs, less water loss and safer roads.
- **Adjacent pools open once the rail exists:** civic analytics for planners, assisted filing through Common Service Centres and gram panchayats, integration services, and outcome-linked contracts.

- **Strategic position.** The first credible, open civic-voice rail can become the default that other channels connect to, as UPI did for payments.

So what

We should be judged as public infrastructure with a sustainable business model, not as a venture-scale consumer app. The model is designed to be profitable at modest scale and to stay trusted at national scale.

4. Business model and pricing

Free for citizens, paid by governments at about ₹1 to ₹2 per resident a year, with a share of the fee tied to service levels.

Five revenue streams

Exhibit 7 Revenue streams and role in the model

Stream	What it is	Role
1. Government subscription	Annual per-resident fee for a jurisdiction (taluk or ward, city, district, state).	Core and recurring. About 70 percent of revenue by year 5.
2. Implementation and integration	One-time fee: onboarding, data set-up, training, integration with existing grievance systems.	Funds delivery; roughly 25 percent of new annual contract value.
3. Civic insights	Subscriptions to anonymised, aggregated analytics for departments, planners and researchers.	High margin; starts in year 3.
4. Assisted filing (Voice Mitra)	A small per-filing fee for reports assisted at Common Service Centres and panchayat offices.	Extends reach to citizens without smartphones.
5. CSR and philanthropic grants	Funding for language access, outreach and assisted filing in underserved areas.	Keeps the citizen side free; steady ₹1 to 1.5 crore a year.

The price card

Exhibit 8 Public price card (illustrative; to be published openly)

Tier	Buyer	Price	Example annual contract
90-day pilot	Any office	Free	Gets real data and a joint review
Taluk or ward office	Tahsildar, ward officer	₹2 lakh flat, up to 5 lakh residents	₹2 lakh
Urban local body	City or town council	₹2.0 per resident, minimum ₹6 lakh	10-lakh city: ₹20 lakh
District	District Commissioner	₹1.5 per resident	22-lakh district: ₹33 lakh
State enterprise licence	State government	₹1.0 per resident, with volume tiers	6.9-crore state: about ₹7 crore
Insights subscription	Departments, researchers	₹5 to 25 lakh a year	By data scope
Citizens	Everyone	Always free	No ads, no data sale

Source: team pricing proposal. Per-resident prices fall with scale and decline in the blended model from ₹2.0 (year 2) to ₹1.1 (year 5).

Why this price is defensible

- **It is small against the value.** At 1.5 percent of residents reporting a year, a 22-lakh district files about 33,000 reports. At ₹175 of measured citizen and official time saved per report, that is about ₹58 lakh of value a year against a ₹33 lakh fee, before the value of faster repairs.
- **It is small against the budget.** ₹1 to ₹2 per resident a year is a rounding error in a state's e-governance and municipal spend, and far below the cost of a custom portal.
- **It is simple.** One public price card lets any office buy through the Government e-Marketplace without a bespoke tender.

Pricing principles

6. **Citizens are never the product.** No advertising and no sale of personal data, ever.
7. **Pay for performance.** 15 percent of each government fee is tied to service levels (availability, response times, closure confirmation reporting), so the buyer's risk is shared.
8. **Transparent.** The price card is public. Discounts apply to multi-year terms and to joint rollouts across several offices.
9. **Start free, prove, then pay.** A 90-day pilot with a joint review removes procurement risk for the first buyer.

Unit economics of one district contract

Exhibit 9 A 22-lakh-resident district, steady state (illustrative)

Line	₹ lakh a year	Assumption
Contract fee (₹1.5 per resident)	33.0	Price card
Cloud, photo checks and messaging	(1.3)	33,000 reports at about ₹4 each
Customer success and delivery	(6.6)	20 percent of fee
Gross contribution	**25.1**	**76 percent**
Cost to win the contract (sales, pilot support)	(8.0)	One-time, about 6 to 9 month sales cycle
Payback on acquisition cost	About 4 months of contribution	Excludes implementation fee of about ₹8 lakh in year 1

Source: team model; assumptions in Appendix A.

Sensitivity: what moves year-5 operating surplus

Year-5 surplus (₹ crore)	Coverage 50%	Coverage 75%	Coverage 100%	Coverage 150%
Price 80% of plan	(2.9)	(0.7)	1.5	5.9
Price at plan	(1.7)	1.1	3.9	9.4
Price 120% of plan	(0.5)	2.9	6.2	13.0

Source: team model with the cost base held at plan; brackets denote a deficit. In practice hiring would slow if coverage fell short, as the conservative scenario shows.

5. Go-to-market

Land with one office that can say yes, prove value in 90 days, then expand across offices and levels of government.

The sales logic: land and expand

Exhibit 10 The expansion ladder inside one geography

Step	Move	Trigger to the next step
1. Land	Free 90-day pilot with a Tahsildar, ward officer or MLA office.	Joint review shows time to acknowledge and share confirmed fixed.
2. Extend	Add neighbouring taluks, wards and the city corporation.	District Commissioner asks for a district view.
3. District	District contract with a District Commissioner; assign workers across departments.	State asks for a statewide rail and analytics.
4. State	State enterprise licence; integration with the state grievance system and CPGRAMS.	Neighbouring states ask for it.

Channels

- **Direct to government.** A small team of public-sector solution leads working with district and city administrations.
- **Government e-Marketplace (GeM).** A listed product and a public price card shorten procurement.
- **Startup-friendly procurement.** Use available relaxations for recognised startups on prior experience and turnover, as policy allows.
- **Common Service Centres and gram panchayats.** 'Voice Mitra' operators help first-time users and earn a small fee per assisted filing.
- **Civil-society and resident-association partners.** Outreach and trust in communities, supported by CSR.
- **Technology partners.** Bhashini for language, the national e-governance bodies for standards, and cloud providers on the government-empanelled list.

What a buyer needs to hear

10. It is free to try, with a joint success review at day 90.
11. Officials see only their own area, and citizens' identities are never exposed.
12. It plugs into what you already have; it does not replace your portal.
13. A share of the fee is tied to service levels you can audit.
14. Citizens get a better experience; you get proof of work.

Why elected representatives matter

MLA and MP offices are not the main payers, but they are the main champions. They want a clear view of their constituency and a fair record. The leaderboard ranks on the share of reports fixed, not on how

many problems an area has, so a busy ward is not penalised. Included in the area contract, the elected representative's view brings political sponsorship to a rollout that otherwise depends on a single officer.

6. Financial outlook and funding need

Base case: operating break-even in year 4, ₹19.4 crore revenue in year 5, and a funding need of about ₹3.2 crore driven by government payment cycles.

Exhibit 11 Five-year plan, base case (₹ crore)

	Year 1	Year 2	Year 3	Year 4	Year 5
Revenue	**0.8**	**1.8**	**5.4**	**10.2**	**19.4**
Government subscription	0.0	0.6	3.0	6.6	13.2
Implementation and integration	0.0	0.2	0.6	0.9	1.7
Civic insights	0.0	0.0	0.2	0.8	2.0
Assisted filing	0.0	0.0	0.1	0.4	1.0
CSR and grants	0.8	1.0	1.5	1.5	1.5
Costs	**0.7**	**2.6**	**5.6**	**9.7**	**15.5**
Team	0.5	1.8	3.6	6.0	9.0
Cloud, photo checks, messaging	0.0	0.0	0.1	0.3	0.7
Customer success and delivery	0.0	0.2	0.7	1.5	3.0
Sales, field and outreach	0.2	0.4	0.8	1.3	1.9
Legal, audit, other	0.1	0.3	0.4	0.6	0.9
Operating surplus	**0.1**	**(0.9)**	**(0.2)**	**0.5**	**3.9**
Cumulative surplus	0.1	(0.8)	(1.0)	(0.5)	3.4
Cumulative cash after payment delays	0.1	(1.0)	(2.2)	(3.2)	(2.2)

Source: team model; assumptions in Appendix A. Brackets denote negative values. Year 1 is the free pilot year; revenue is CSR and grant funding. Receivables assume a 120-day government payment cycle.

Exhibit 12 Revenue and operating surplus by year, base case (₹ crore)

Source: team model. Teal bars are surplus; rose bars are deficits shown at minimum length.

Three scenarios

Exhibit 13 Scenario comparison, year 5 and cash need

	Conservative	Base	Ambitious
Residents covered, year 5 (crore)	6.0	12.0	18.0
Revenue, year 5 (₹ crore)	10.4	19.4	26.8
Operating surplus, year 5 (₹ crore)	1.2	3.9	9.4
Operating break-even year	Year 5	Year 4	Year 3
Peak cumulative cash need (₹ crore)	2.7	3.2	1.4
What differs	Half the coverage, prices 20 percent lower, hiring slowed by about a third from year 3	Plan	Coverage 50 percent higher

Source: team model. In the conservative case the cost base is flexed down; without that the business would not break even.

What drives the shape of the curve

- **Cost base is mostly people.** Cloud and photo checks are cheap: about ₹4 per report all in. The plan is dominated by team and delivery cost, which we control.
- **Government pays slowly.** A 120-day payment cycle turns a profit into a cash deficit while the company grows, which is why the funding need is larger than the accounting loss.
- **Margins improve with scale.** Fixed engineering is spread over more residents; the surplus margin reaches about 20 percent in year 5 in the base case and rises further beyond.
- **Grants smooth the early years.** CSR and philanthropic funding keep the citizen side free and fund outreach, and are not needed for the core subscription to be viable.

Funding need

Peak cumulative cash need across scenarios is about ₹2.7 to ₹3.2 crore (conservative and base). We plan for ₹3.5 crore of patient capital, a mix of challenge grant, impact and angel investment, CSR and a government pilot budget, which covers the base-case trough with a buffer.

7. Impact: what changes for citizens and for governance

Measured value of about ₹31.5 crore a year by year 5 from time saved alone: about ₹2.1 of value for every ₹1 governments pay.

A simple, conservative value model

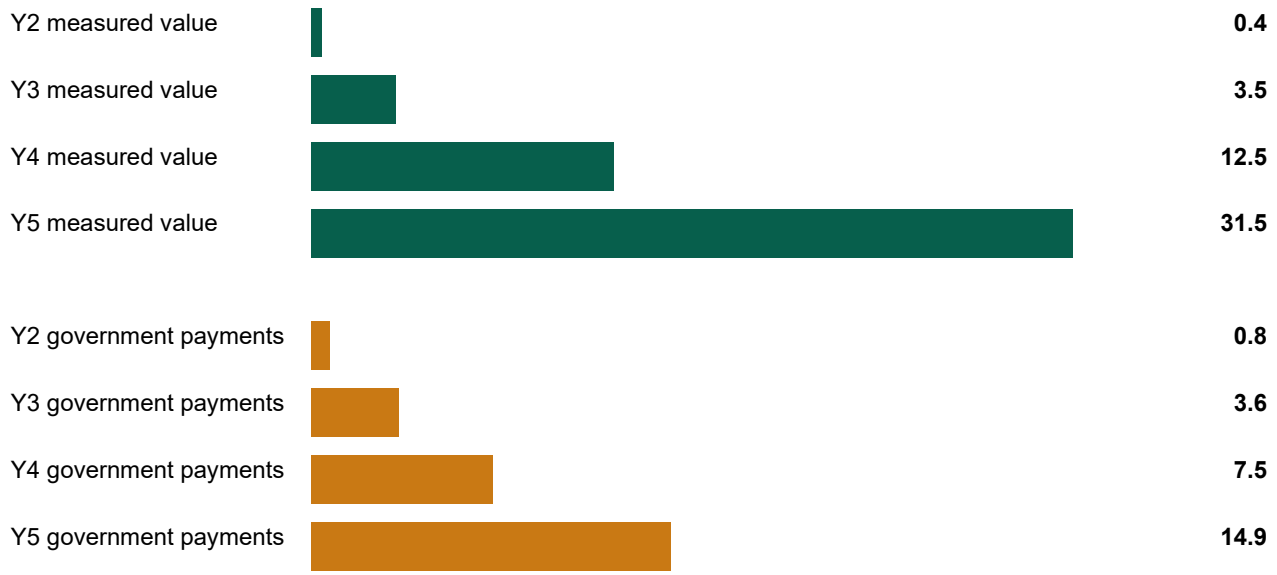

We count only what we can defend: the time citizens save and the time officials save. We do not count the value of faster repairs, avoided accidents, reduced water loss or better planning. Those are real but harder to measure, and we will measure them in the pilot.

Exhibit 14 **Value per report (assumptions)**

Item	₹ per report	Basis
Citizen time saved (no travel, no repeat visits, no chasing)	100	About 1.5 hours at about ₹65 per hour of time
Official time saved (routing, duplicate triage, status calls)	75	About 15 minutes at about ₹300 per hour of official time
Measured value per report	**175**	**Excludes faster repairs and downstream benefits**

Source: team assumptions, to be validated with time-and-motion measurement in the pilot.

Exhibit 15 **Measured value versus what governments pay (base case, ₹ crore)**

Source: team model. In years 2 and 3 payments exceed measured value because adoption is still building; the gap closes by year 4 and reverses by year 5.

Governance outcomes

Outcome	How Prajadhwani delivers it
Transparency	Public report cards, an open map and a feed make the state of civic services visible to anyone.
Accountability	Every ticket has an area owner and an assigned worker; the history records who changed what and when; the leaderboard shows the share of reports fixed.
Responsiveness	Emergencies and hotspots are surfaced automatically; assignment can be done in bulk.
Participation	'Me too' and comments let neighbours support a report; citizens confirm fixes.

Outcome	How Prajadhwani delivers it
Evidence-based planning	Structured, geotagged, clustered data across districts, taluks and constituencies, with AI briefings and PDF reports.
Inclusion	Voice in 10 languages and assisted filing for citizens without smartphones.
Privacy and trust	Anonymised public layer, consent-based photos, privacy terms, access limited to one's own area.

Alignment with global goals

Prajadhwani contributes to SDG 16 (peace, justice and strong institutions: accountable, transparent institutions and responsive decision-making), SDG 11 (sustainable cities and communities: basic services) and SDG 6 (clean water and sanitation) through faster action on supply and drainage failures.

How we will know: the scorecard

Exhibit 16 Impact scorecard for the pilot and beyond

Metric	Why it matters	Pilot target (to be set with partner)
Median time to acknowledgement by an official	Responsiveness	Within 2 days
Share of reports assigned to a named worker within 3 days	Ownership	At least 60 percent
Share of fixed reports confirmed by the citizen	True closure	Tracked; reopen rate published
Share of reports filed in a language other than English	Inclusion	At least half in the pilot area
Citizen satisfaction (in-app)	Trust	Baseline set in the first 30 days
Repeat complaints for the same issue	Quality of fixes	Falling over the pilot

8. Digital India alignment and the public-rail strategy

Prajadhwani turns Digital India's three goals into a working service: digital infrastructure, governance on demand, and digital empowerment of citizens.

Exhibit 17 Alignment with Digital India and national priorities

National priority	How Prajadhwani contributes
Digital infrastructure as a core utility	A shared, open rail that departments and apps can plug into, in the spirit of UPI, Aadhaar and DigiLocker.
Governance and services on demand	Citizens reach the right office from a phone; officials act from a single queue; status is visible to all.
Digital empowerment of citizens	Voice-first, 10 languages, assisted filing for people without smartphones; citizens decide when a fix is real.
Bhashini and the National Language Translation Mission	Prajadhwani uses Bhashini for speech recognition, translation and language detection, and can help show Bhashini's value in live public service.
Digital Personal Data Protection Act, 2023	Consent for public photos with a recorded terms version, purpose limitation, data minimisation, anonymised public layer, role-scoped access.
Government e-Marketplace and startup procurement	Public price card and a standard product make purchase simple.
Common Service Centres and gram panchayats	'Voice Mitra' assisted filing brings the last mile into the system.
Mission Karmayogi and capacity building for officials	Training modules for officials and workers can sit inside the platform.
Ease of Living and Viksit Bharat ambitions	Faster fixes to everyday problems are the most visible form of ease of living.

From product to public rail: three layers

Exhibit 18 The path from an app to a rail

Layer	What it is	Why it matters
1. Product	The citizen app, official dashboard, worker app and admin console.	Proves value to citizens and officials.
2. Open API	A documented interface for filing, routing, status and anonymised data, so other channels (WhatsApp, IVR, kiosks, city apps) can plug in.	Turns a product into a platform; every new channel increases value.
3. Open standard	A common data model and service levels for a civic grievance, agreed with government and civil society.	Makes it a rail: interoperable and not owned by one company.

Governing the rail

Public rails earn trust through governance as much as technology. We propose to separate the commercial company from the open standard: the company operates the service and sells subscriptions, while a non-profit foundation, with government, civil-society and academic members, holds the open standard, the data-protection charter and the public leaderboard methodology. This protects against capture and gives departments a reason to adopt.

The vision

A citizen in any village or ward of India speaks one sentence in their own language. It reaches the right office, is assigned to a named person, is fixed, and comes back to the citizen to confirm.

Every grievance channel in the country, whether a state helpline, a city app or a national portal, speaks to the same rail, so a citizen never has to start again.

9. Expansion roadmap

Expand in layers: depth in Karnataka first, then neighbouring language-fit states, then the Hindi belt and the rest.

Exhibit 19 Phased roadmap

Phase	Timing	Scope	Exit criteria
0. Prove	Months 0 to 6	One taluk or ward cluster; one MLA or MP office; free pilot.	Pilot scorecard met; written partner reference.
1. Deepen	Months 6 to 14	A full district and two cities in Karnataka; alerts, official replies visible to citizens, escalation and deadlines.	First paid district and city contracts.
2. Statewide	Months 14 to 30	Karnataka state enterprise licence; CPGRAMS and state-system connectors; department scorecards.	State licence signed; 2 crore or more residents covered.
3. Neighbours	Months 30 to 48	Maharashtra, Tamil Nadu, Telangana, Andhra Pradesh, Kerala; language packs and area data.	Two additional state contracts.
4. National rail	Months 42 to 60	Hindi belt and Gujarat, West Bengal, Punjab; open API partners; open standard adopted.	Around 12 crore residents covered; foundation set up.

Choosing the next states

Exhibit 20 State prioritisation (team judgement, to be validated)

State	Population (crore, approx.)	Language fit (supported)	Digital readiness	Priority
Karnataka	6.9	Kannada, English	High	Home state: first
Maharashtra	12.6	Marathi, Hindi, English	High	Second wave
Tamil Nadu	7.7	Tamil, English	High	Second wave
Telangana	3.8	Telugu, Hindi, English	High	Second wave
Andhra Pradesh	5.3	Telugu, English	Medium to high	Second wave
Kerala	3.5	Malayalam, English	High	Second wave
Gujarat	7.3	Gujarati, Hindi, English	High	Third wave
West Bengal	10.0	Bengali, English	Medium	Third wave
Punjab	3.1	Punjabi, Hindi, English	Medium	Third wave
Hindi-belt states	About 68	Hindi, English	Varies	Third wave, by state

Source: rounded, approximate population figures; team judgement on readiness. Verify against the latest official estimates before external use.

What changes when we enter a new state

- Reference data: areas, boundaries, representatives and the directory of offices (the main work).
- Language quality review by native speakers.
- Integration with the state's existing grievance system.
- Local partners for outreach and assisted filing.
- No new product build: access, language and routing are configuration, not new code.

Capability expansion

- **More channels:** WhatsApp, IVR and kiosks for citizens who do not use the app.
- **More languages:** Odia, Assamese and others as Bhashini coverage grows.
- **Deeper service:** Deadlines and escalation, official replies visible to citizens, department scorecards, links into existing grievance systems.
- **More uses of the same rail:** Disaster and emergency alerts, scheme-delivery feedback, and public-works progress tracking.

10. Operating model, platform governance and team

A lean team, a clear governance charter and independent oversight make the platform safe to hold public trust.

Team and hiring plan

Exhibit 21 Team by phase

Function	Year 1	Year 3	Year 5	Notes
Engineering and data	3	7	14	Mobile, backend, data, AI, security
Product and design	1	2	4	Including accessibility and language quality
Government partnerships and delivery	2	6	14	Solution leads in each state
Customer success and training	0	3	8	Training for officials and workers
Field outreach and Voice Mitra programme	1	3	6	CSC and panchayat network
Legal, finance, operations	1	2	4	Including data protection officer
Total	**8**	**23**	**50**	

Source: team plan. Consistent with the team cost lines in Exhibit 11.

Platform governance: the rules that protect trust

Principle	How it is enforced
Purpose limitation and data minimisation	Only the data needed to route and fix a report is collected; the public layer carries an allow-listed set of fields, audited regularly.
Consent and control	Photos are private by default; public only after the citizen accepts versioned privacy terms; they can withdraw at any time and the public copy is deleted.
Least-privilege access	Officials see only their own area; field workers see only tickets assigned to them; every status change records who and when.
Transparency of method	The leaderboard method is published: ranked by share fixed, not volume; seats without a sitting member are not ranked; trial data is never counted.
No invented facts	Official contacts come only from a verified directory; AI never generates them.
Abuse and safety	Comment moderation, rate limits, reporting and removal; automatic safe-search check on every public photo.
Independent oversight	An advisory board with government, civil-society, academic and citizen representatives reviews privacy, fairness and performance every quarter.
Security	Independent security audit before real data is held; role-based rules validated; incident response plan; data stored in India on government-empanelled cloud where required.

Service levels we publish

- Platform availability and response times, reported monthly.
- Share of reports acknowledged by an official within 2 days, per area.
- Share of fixed reports confirmed by citizens, and the reopen rate, per area.

- Time to remove abusive content and to withdraw a public photo.

11. Risks and how we manage them

The largest risks are institutional rather than technical: procurement, adoption and political sensitivity.

Exhibit 22 **Risk register**

Risk	Likelihood	Impact	Mitigation
Slow government procurement and late payment	High	High	Free 90-day pilot; GeM listing; public price card; multi-year terms; 120-day receivables in the plan; CSR and grants as a buffer.
Officials do not adopt the tools	Medium	High	Area-scoped, simple queue; training and support; elected-representative sponsorship; adoption metrics in the review.
Political sensitivity of the leaderboard	Medium	Medium	Rank on share fixed, not volume; publish the method; never rank vacant seats; start with opt-in areas if needed.
Privacy incident or misuse of photos	Low	High	Private by default; consent and versioned terms; blur and EXIF removal; safe-search; least-privilege access; security audit; breach response plan.
Language quality errors	Medium	Medium	Native-speaker review; citizen can edit text; fall-back providers; continuous testing.
Dependence on third-party services (Bhashini, cloud)	Medium	Medium	Fall-back providers already built; data portability; negotiate production quota; multi-region plan.
Spam and abuse	Medium	Low	Moderation, rate limits, reporting, token-based accountability.
Competition or a government-built alternative	Medium	Medium	Position as an open rail that integrates with CPGRAMS and state systems; offer to adopt as the standard.
Trust gap: citizens do not believe it will work	Medium	High	Publish the scorecard; citizen confirmation; visible fixes; focus the first pilot where a partner is committed.
Key-person and funding risk	Medium	High	Document everything; hiring plan; a 3.5 crore funding plan with a buffer; cost flex shown in the conservative case.

Source: team assessment.

12. The next 24 months and the 100-day plan

We are ready to start the pilot within days of a partner signing.

The 100-day plan

Days	What we do
0 to 15	Sign a letter of support or MoU with the pilot office. Load the area data, directory of offices and officials. Set baselines for the scorecard.
15 to 30	Onboard the MLA or MP office, ward officer, Tahsildar and first field workers. Train them. Finish a security and privacy review of the pilot set-up.
30 to 60	Launch to citizens through ward and community partners and Voice Mitra stalls. Daily review of reports, assignments and closures.
60 to 90	Fix what the pilot shows. Add alerts and official replies visible to citizens. Run a citizen and official survey.
90 to 100	Joint review with the partner against the scorecard. Publish results. Agree the paid contract.

Milestones

Exhibit 23 **24-month milestones**

By	Milestone
Month 3	Pilot live with a government partner; baseline measured.
Month 6	Pilot scorecard published; first paid contract; security audit complete.
Month 12	A full district live; two cities signed; alerts, official replies and escalation shipped.
Month 18	Integration with a state grievance system; Karnataka state discussions under way.
Month 24	Karnataka statewide agreement signed or in procurement; 1 crore or more residents covered; the open API published.

13. The ask and the use of funds

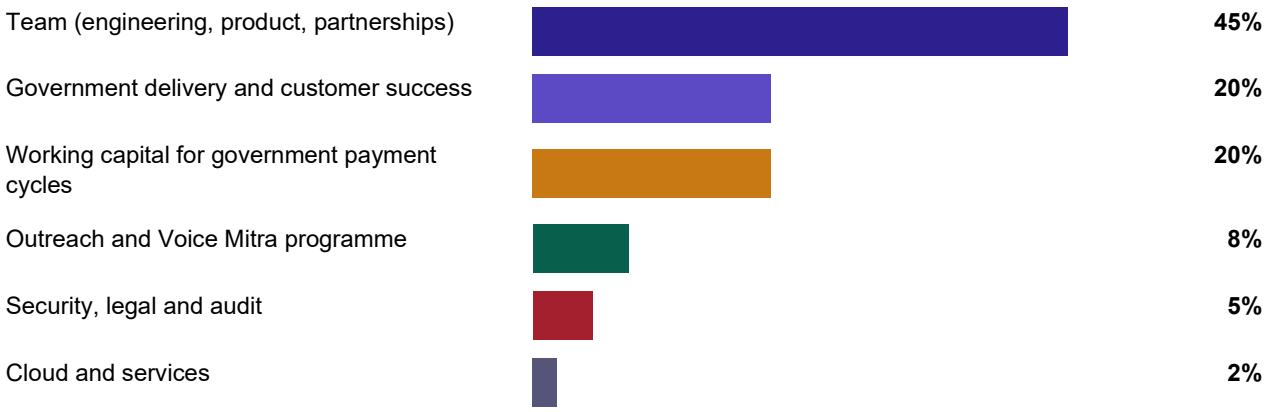

We ask for a pilot partner, patient capital of about ₹3.5 crore and a handful of enabling supports.

Exhibit 24 What we need

Support	Why	Size
Pilot partner in government	A named ward, taluk, district or city office and one MLA or MP office to use the dashboards on real reports.	Letter of support or MoU
Patient capital	To fund the team, delivery and the cash gap created by government payment cycles until break-even.	About ₹3.5 crore in total; challenge grant of ₹[__] lakh towards this
Bhashini production access	A production quota and technical contact for speech and translation at pilot and state scale.	Access
Legal and privacy review	Review of the privacy terms and data-sharing arrangements under the Digital Personal Data Protection Act, 2023.	Pro bono or ₹3 to 4 lakh
Independent security audit	Before real citizen data is held.	₹2 to 3 lakh
Mentoring and introductions	Government partnerships, public procurement, civic-tech product and policy.	Mentors
Cloud credits and platform visibility	Lower pilot costs; introductions to officials and civil society.	Credits and launch event

Use of funds: ₹3.5 crore

Exhibit 25 Planned use of the ₹3.5 crore over the first four years

Source: team plan.

Why Prajadhwani should win in Business and Governance

A real business. Clear buyers, a public price card, positive unit economics and a plan that survives a conservative case.

A real governance gain. Transparency, accountability, inclusion and citizen-confirmed closure, with privacy built in.

Already built. A tested product, so the funding goes into a pilot and a business, not a prototype.

A Digital India fit. Built on Bhashini, aligned with the DPDP Act, sold through GeM, and designed to become an open public rail.

Honest about risk. We show the conservative case, the payment-cycle cash gap and what we have not yet proven.

Appendix A: Assumptions

All financial and impact figures in this report come from one transparent model. Change any assumption and the report's figures change with it.

Assumption	Value (base case)
Residents covered by paid contracts, year 1 to 5 (crore, average over the year)	0.05, 0.3, 2, 5.5, 12 (year 1 is a free pilot)
Blended price per resident per year, year 1 to 5 (₹)	0, 2, 1.5, 1.2, 1.1
Reports per resident per year, year 1 to 5	0.008, 0.008, 0.01, 0.013, 0.015
Implementation fee as share of new annual contract value	25 percent
Customer success and delivery cost	20 percent of subscription and implementation revenue
Government payment cycle	120 days
Civic insights revenue, year 1 to 5 (₹ crore)	0, 0, 0.2, 0.8, 2
CSR and grants, year 1 to 5 (₹ crore)	0.8, 1, 1.5, 1.5, 1.5
Assisted-filing revenue, year 1 to 5 (₹ crore)	0, 0, 0.1, 0.4, 1
Team cost, year 1 to 5 (₹ crore)	0.48, 1.8, 3.6, 6, 9
Sales, field and outreach, year 1 to 5 (₹ crore)	0.15, 0.4, 0.8, 1.3, 1.9
Legal, audit and other, year 1 to 5 (₹ crore)	0.1, 0.25, 0.4, 0.6, 0.9
Cloud, photo checks and messaging	₹4 per report
Measured value per report	₹175 (citizen time 100, official time 75)
Year-1 reports	About 5,000 (pilot)

Appendix B: Scenario detail

Conservative case (₹ crore)

	Year 1	Year 2	Year 3	Year 4	Year 5
Revenue	0.8	1.6	3.2	5.7	10.4
Costs	0.7	2.6	3.4	5.9	9.2
Operating surplus	**0.1**	**(1.0)**	**(0.3)**	**(0.2)**	**1.2**
Cumulative cash after payment delays	0.1	(1.1)	(1.7)	(2.6)	(2.7)
Reports (lakh)	0.1	0.2	1.0	3.6	9.0
Measured value	0.1	0.4	1.8	6.3	15.8

Ambitious case (₹ crore)

	Year 1	Year 2	Year 3	Year 4	Year 5
Revenue	0.8	1.8	7.3	14.0	26.8
Costs	0.7	2.6	6.0	10.6	17.3
Operating surplus	**0.1**	**(0.9)**	**1.3**	**3.4**	**9.4**
Cumulative cash after payment delays	0.1	(1.0)	(1.4)	(0.1)	5.3
Reports (lakh)	0.1	0.2	3.0	10.7	27.0
Measured value	0.1	0.4	5.3	18.8	47.3

Appendix C: Glossary

Term	Meaning
Bhashini	The Government of India's language platform for speech recognition, translation and language detection in Indian languages.
CPGRAMS	The Centralised Public Grievance Redress and Monitoring System, the national grievance portal.
CSC	Common Service Centre: a local access point for digital government services.
DPDP Act	The Digital Personal Data Protection Act, 2023.
GeM	Government e-Marketplace, the public procurement portal.
DPI	Digital public infrastructure: shared digital rails such as UPI, Aadhaar and DigiLocker.
Voice Mitra	A trained local helper who assists citizens to file a report by voice.
Token ID	The receipt code each report receives; it carries no personal information.
TAM, SAM, SOM	Total, serviceable and obtainable market.

Appendix D: Notes on figures

- All forward-looking numbers are estimates built on the assumptions in Appendix A. They are not forecasts of guaranteed results.
- Population and administrative counts (140 crore residents; state populations; 224 assembly constituencies and 28 Lok Sabha constituencies in Karnataka) are rounded and approximate; verify against the latest official sources before external use.
- Competitor comparisons are by category and are the team's hypotheses to test in the pilot.
- Evidence of the working product is based on live tests run by the team on the deployed system, including 10 of 10 languages with Bhashini, 20 of 20 workflow checks, 18 of 18 photo-privacy checks and 64 automated app tests. No real-citizen pilot has been run.
- Placeholders in square brackets, such as the team name and the challenge grant amount, are to be filled in before submission.
