

THE VISION

Every community already knows what it needs. We are building the instrument that lets a government **hear all of it at once** — and prove where the money should go.

THE PROBLEM

Public money is allocated on instinct — at scale, today.

A complaint reaches one clerk and one file. Nobody counts how many other people reported the same failure, so local budgets follow petitions, party channels and guesswork. **Every misallocation is spent before anyone can measure that it was wrong** — and each unanswered report teaches a citizen not to bother again. Local bodies across India commit development spending every year with no instrument that tells them what their own population actually asked for.

THE CONCRETE IDEA

A civic intelligence platform for local development planning.

A citizen speaks a problem or a suggestion into a phone, in their own language — no form, no literacy requirement, thirty seconds. Our AI transcribes and translates it, groups it with every other report describing the same issue in the same area, scores that group against who is affected, identifies the root cause, tags it to a specific UN Sustainable Development Goal target, and routes it to the department and officer accountable for the fix.

The official receives a ranked development agenda with evidence behind every line. The citizen receives a token number they can track.

The same map is public — which is what converts a complaint box into an accountability system.

WHAT HAS ALREADY BEEN DONE

The platform is **built and operational end to end** — citizen app, AI pipeline, official workspace, public map and statewide boundary data. It has not yet been opened to citizens or government outside the founding team; this raise is to put it in the field.

Working today: voice/photo/text capture in 10 languages · four-agent AI analysis chain · automatic department routing · anonymised public dashboard · statewide interactive map · official briefing PDFs.

GROUND ALREADY COVERED — THE SLOW, UNGLAMOROUS GROUNDWORK IS COMPLETE

543

Parliamentary constituencies mapped nationwide

227

Karnataka taluks, across all 30 districts

369

Bengaluru civic wards, boundary-accurate

10

Indian languages, voice-first

16

Departments wired for automatic routing

WHY THIS IS A SUSTAINABILITY INNOVATION

Sustainable development fails locally not for lack of goals but for lack of ground truth. A district officer cannot act on a national target; they act on what they believe their area needs. Prajadhwani makes that belief measurable.

Every clustered issue is tagged to a specific SDG **target** — not merely a goal number — so a local body can report its development spending against the global framework as a by-product of doing its work, rather than as a separate reporting exercise.

SDG targets mapped in the product

- ◆ **SDG 6** — Clean water and sanitation
- ◆ **SDG 11** — Sustainable cities and communities
- ◆ **SDG 3** — Good health and well-being
- ◆ **SDG 9** — Industry, innovation and infrastructure
- ◆ **SDG 4** — Quality education · **SDG 7** — Clean energy · **SDG 13** — Climate action

IMPLEMENTATION — HOW ONE REPORT BECOMES A DECISION

01 · CAPTURE Speak, don't fill a form Voice, photo or text in 10 languages. Location is captured to ward or taluk precision automatically.	02 · CLUSTER One voice becomes evidence Identical issues in the same area are grouped and scored against population and infrastructure gaps.	03 · ANALYSE Four AI agents, in sequence Root cause → proposed solution → responsible department and officer → compiled official briefing.	04 · ACT Ranked, tracked, public Officials work a ranked queue; citizens track a token; the anonymised map is open to everyone.
---	---	---	--

UNIQUE VALUE PROPOSITION

The only platform that converts unstructured citizen speech into a ranked, SDG-tagged, department-routed development plan — without ever revealing who spoke.

ADDED VALUE OVER THE ALTERNATIVES

- ◆ **A planning instrument, not a complaint pipe.** Every existing system moves one complaint to one desk. We convert thousands of them into a prioritised agenda a budget can be written against.
- ◆ **Voice-first and vernacular.** Written forms in English or formal Hindi silently exclude the people with the most to report. Speech in 10 languages removes that filter.
- ◆ **Privacy by construction.** Officials see a token, a problem and an area — never a name, phone or address, because those fields are never written to the data an official can read. It is a property of the system, not a policy.
- ◆ **SDG reporting as a by-product.** Sustainability accounting falls out of normal operation rather than requiring a separate audit.
- ◆ **Geography others must still build.** Every district, taluk and ward boundary already digitised and matched to its representatives and departments.

WHY NOW

Two conditions became true only recently. Vernacular speech AI reached the accuracy and the price point where a thirty-second Kannada voice note can be understood at scale. And India's digital public infrastructure normalised phone-based identity and location for hundreds of millions of people.

Neither was true five years ago. Both are now true everywhere in the developing world — which is why the same instrument, once proven in one Indian state, is not India-specific.

Barriers to imitation

The defensible asset is not the model — it is the boundary and accountability graph beneath it: who represents this polygon, which department owns this category here, and which officer answers for it. That is slow, unglamorous, jurisdiction-by-jurisdiction work, and it compounds with every area added.

COMPETITOR ANALYSIS — THE CIVIC-TECHNOLOGY FIELD

PLATFORM	WHAT IT DOES WELL	WHERE IT STOPS
Swachhata (national, Govt of India)	Mass reach for sanitation complaints; official standing	Single-domain; individual complaints, no clustering or prioritisation
CPGRAMS (national grievance portal)	Formal, auditable grievance redressal with escalation	Text and English-centric; case-by-case, not area patterns; no planning output
Municipal apps (e.g. Bengaluru's civic apps)	Direct routing into one city's departments	One city; complaint routing only; no cross-area intelligence or ranking
Civic-society platforms (e.g. NGO-run reporting)	Strong citizen trust and campaigning	Outside the official workflow; not a budgeting instrument for government
International 311 / request systems	Mature service-request management for cities	English-first, city-scale, service-desk model; not constituency development planning
Prajadhwani	Voice in 10 languages → clustered, ranked, SDG-tagged, department-routed plan; public and anonymised	Pre-market: no external users yet — the risk this raise addresses

Positioning reflects each platform's published purpose. Verify current feature sets before submission — public-sector products change without notice.

PRICING — ANNUAL LICENCE, BY SIZE OF THE LOCAL BODY

CUSTOMER	PER YEAR	KARNATAKA BASE
Town panchayat / taluk body	₹25,000	227
Municipal council / assembly segment	₹50,000	224
City corporation / district / parliamentary seat	₹1,00,000	58

Priced deliberately below a government IT procurement threshold so it is an operational decision rather than a tender. **This is a volume model:** full Karnataka coverage represents roughly **₹2.3 crore of annual recurring revenue**, and the equivalent national base approaches **₹40 crore**. Scale comes from breadth of adoption, not from price.

- FINANCIAL DYNAMICS**
- ◆ **Recurring by nature.** An annual licence renewed by a body that has embedded the tool in its planning cycle; switching means losing its own history.
 - ◆ **Target gross margin ≈ 85%.** The only meaningful variable cost is cloud and AI inference, which falls per report as volume rises.
 - ◆ **Land and expand.** Entry at one taluk; expansion to the district and then the state is a pricing change, not a new build.
 - ◆ **Break-even ≈ 400–450 paying bodies** at the planned cost base — reachable within Karnataka alone, without a second state.

UNIT ECONOMICS — PER LOCAL BODY, AT PLAN

MEASURE	ASSUMED
Average annual licence (blended)	₹48,000
Cloud & AI cost to serve, per year	₹7,000
Gross profit per body per year	₹41,000
Cost to acquire (field onboarding)	₹35,000
Payback period	≈10 months
Assumed annual retention	85%
Lifetime value : acquisition cost	≈7.8×

- FUNDING SOURCES**
- ◆ **Seed equity — ₹2–3 Cr (primary).** Impact and early-stage funds active in Indian govtech and climate/ sustainability.
 - ◆ **Non-dilutive grants.** State startup-innovation programmes and sustainability innovation awards; targeted at the pilot and compliance costs.
 - ◆ **Early customer revenue.** Paid pilots convert during month 6–12 and fund a share of onboarding.
 - ◆ **CSR and development partners.** Fund anonymised insight reporting in districts they already work in.

- PRINCIPAL RISKS AND HOW THEY ARE MANAGED**
- ◆ **Government sales cycles are slow.** Mitigated by pricing below tender thresholds and by entering at taluk level, where a single officer can decide.
 - ◆ **Adoption depends on citizens speaking up.** Field onboarding is funded as a first-class cost line, not assumed to happen by itself.
 - ◆ **Data protection scrutiny.** The anonymisation is architectural, and a security and DPDP compliance audit is funded in the first quarter.

- WHAT THE PROJECTION RESTS ON**
- ◆ **No traction is assumed from history.** There are no external users today, so every figure above is a forward assumption, not an extrapolation of a trend.
 - ◆ **Adoption is sequential, not viral.** Each body is won by direct field engagement; growth is modelled on team capacity, not on organic spread.
 - ◆ **Retention is the load-bearing assumption.** At 85% the model works; below roughly 70% the break-even point moves outside Karnataka and a second state becomes necessary rather than optional.
 - ◆ **Insight-report revenue is treated as upside** and excluded until year three.

TIMELINE OF NEXT STEPS — 18 MONTHS

Q1

Make it safe to deploy
Security and data-protection audit; first pilot agreement with one constituency office; Kannada field-onboarding kit.

Q2

First real citizens
Three live pilot areas; department integration validated against real reports; first paid conversions.

Q3

Prove the commercial model
25 paying local bodies; published evidence of issues resolved through the platform; predictive layer in alpha.

Q4

Multi-district rollout
75 bodies across several Karnataka districts; first anonymised insight report with a CSR partner.

Q5

From listening to allocating
150 bodies; budget-allocation module in beta with a district administration.

Q6

Prove it repeats
Entry into a second state; ~300 bodies; Series A readiness on demonstrated retention.

IMPACT WE WILL MEASURE AND PUBLISH

- ◆ **Reach.** Reports filed per 1,000 residents in each covered area — the test of whether the voice barrier actually came down.
- ◆ **Responsiveness.** Median days from report to department acknowledgement.
- ◆ **Resolution.** Share of clustered issues closed within one budget cycle.
- ◆ **Equity.** Share of reports coming from areas historically in the lowest quartile of civic spend — the measure that says whether this narrows a gap or widens it.
- ◆ **SDG accounting.** Issues resolved per SDG target, published per local body.

PRODUCT ROADMAP — THE CIVIC INTELLIGENCE LAYER

Listening · built

What citizens are asking for, ranked by area, routed to the accountable department, tagged to an SDG target.

Predicting · months 9–15

Forecast where water, sanitation and road failures will surface next, so budgets move before the breakdown rather than after it.

Allocating · months 15–24

Match ward-level budgets to measured citizen demand and benchmark comparable areas against each other — the system of record for how a democracy spends locally.

THE TEAM

Two to three co-founders covering product engineering, AI, and government partnerships. The raise funds the first engineering and field-operations hires alongside the founding team.

WHY AN AWARD ACCELERATES THIS SPECIFICALLY

The binding constraint is not engineering — the platform is built. It is credibility with the first government customer, who is being asked to trust an unproven vendor with how their constituency is seen.

Independent recognition of the innovation shortens that conversation more than any feature would, and non-dilutive funding is best spent exactly where this plan is thinnest: the security audit and the field onboarding that turn a working product into a used one.

WHAT SUCCESS LOOKS LIKE AT THE END OF THIS PLAN

300

Paying local bodies across two states

2

States live, proving the model repeats

₹2.2Cr

Annual recurring revenue, year three

85%

Target gross margin at scale

₹2.5 crore seed — to put a built platform into citizens' hands.

Karnataka first: ~65 million people, comparable to France.
One state proves the model; the same product then repeats across India's 543 constituencies and every democracy with the same problem.
