

ಪ್ರಜಾ ಧ್ವನಿ · प्रजा ध्वनि · Prajadhvani

Every citizen has a voice. This is how an MP finally hears all of them.

A multilingual, AI-powered civic platform that turns scattered citizen grievances and development suggestions — spoken, typed, or photographed — into a ranked, evidence-backed agenda a Member of Parliament can actually act on.

THE PROBLEM

Democracy generates far more signal than any one office can read.

An MP hears from citizens through **public meetings, letters, social media, grievance portals, and direct representations**. Meanwhile a local development plan already contains dozens of competing proposed projects, each with its own backers.

There has never been an objective way to **consolidate** that feedback, **spot recurring needs**, and **weigh competing proposals against real demand** — to hold, say, a request for school upgrades up against enrolment and travel-distance data, and set it beside a proposed vocational centre.

So the loudest voice, the best-connected constituent, or the most recent letter tends to win — not the need felt by the most people. Genuine demand stays invisible in the noise.

— THE SOLUTION

Prajadhwani makes the whole constituency legible — in one place, in real time.

Citizens submit in the way that's easiest for them. AI does the reading, sorting, and ranking. The MP opens a dashboard that already knows what matters most, and why.

FOR CITIZENS

Report in seconds, in your language

Speak, type, or photograph a problem or a suggestion. No form to decode, no English required, no fear — reporting can be anonymous, and every submission returns a tracking token.

FOR THE MACHINE

Every submission is read and understood

Gemini transcribes the audio, translates it, reads the photo, classifies the theme, scores urgency and demand, and clusters it with everyone else reporting the same thing.

FOR THE MP

A ranked agenda, not an inbox

A demand map with live hotspots, recurring themes ranked by real volume and infrastructure gap, and a printable AI briefing that recommends what to act on first.

One submission, five stages, zero manual sorting.

The citizen's job ends at "submit." Everything after is automatic — and each stage is fault-isolated, so an AI outage never costs a citizen their receipt.

One model, six jobs — all on Gemini 2.5 Flash via Vertex AI.

Rather than stitch together six niche services, a single multimodal model handles the entire language stack, authenticated by the backend's own identity — no API keys to leak, no separate balance to run dry.

SPEECH

Voice → text

Spoken reports in any of the supported languages are transcribed on-device before submit, so the citizen can see and edit the words — with a server-side fallback if they don't.

TRANSLATE

Any language → English

The Cloud Translation API normalizes every submission to English so a Kannada complaint and a Hindi one about the same pothole cluster together instead of drifting apart.

VISION

Photo → caption

A photo of an overflowing drain or a broken road becomes a text description the pipeline can classify — evidence, not just an attachment.

CLASSIFY

Text → theme + four scores

Each report is tagged with a civic theme and scored on priority, citizen demand, demographic weight, and infrastructure gap — the numbers that later rank competing works.

CLUSTER

Many reports → one measured need

Similar reports are grouped per theme, ward, and booth; the group's AI summary refreshes as volume grows, so "128 people want a school near Jalahalli" becomes a single ranked line.

BRIEF

Constituency data → an MP's PDF

On demand, the model reads the whole constituency's clusters and writes an executive summary plus concrete, department-addressed recommendations — a briefing the MP can print and act on.

Aadhaar OCR, too. During sign-up the same vision model reads a citizen's Aadhaar photo to pre-fill name, address, and pincode — the image is held only in function memory for the length of the call, never stored, and the Aadhaar number itself is scrubbed before anything returns. It's a typing shortcut, explicitly not identity verification.

A citizen never submits into a void.

The moment a report is saved — **before** any AI runs — it is stamped with a structured, human-readable token and shown back to the citizen as a receipt:

PD-BLRN-PRB-260708-0042

PD Prajadhvani BLRN constituency PRB problem · SUG suggestion
260708 date 0042 the 42nd report that day

- **Trust.** It mirrors the RTI and courier tracking numbers Indians already rely on — proof the state received you, that you can quote and follow up.
- **Accountability.** Every ticket is uniquely addressable, so nothing can quietly disappear and status is always traceable.
- **Integrity by design.** The sequence is an atomic per-constituency, per-day counter — tokens are genuinely unique and sortable, not merely collision-unlikely.
- **Resilience.** Because the token is minted at save time, a downstream AI failure can never cost a citizen their receipt.

Built end-to-end on Google Cloud & Firebase.

Every layer — identity, data, media, compute, AI, delivery — runs on one billing account and one security model. Nothing to self-host, nothing to reconcile.

GOOGLE TECHNOLOGY	WHAT IT DOES IN PRAJADHWANI
Vertex AI – Gemini 2.5 Flash	The single multimodal brain: transcribes voice, captions photos, reads Aadhaar, classifies and scores every report, summarizes clusters, and writes the MP's briefing.
Cloud Translation API	Normalizes submissions from ten languages into English so identical needs cluster together regardless of the language they were reported in.
Cloud Firestore	The real-time database where every submission, cluster, constituency, ward, taluk, and live counter is stored and streamed straight to citizen and MP screens.
Cloud Functions (2nd gen)	The serverless backend that runs the whole enrichment pipeline, resolves GPS to a constituency, generates reports, and handles MP credential flows.
Firebase Authentication	Handles citizen identity by phone OTP or anonymous session and MP identity by constituency ID + password, with every rule scoped to who you are.
Firebase Cloud Storage	Holds voice and photo evidence, generated PDF briefings, MP portraits, and the public demo APK — each with its own access scope.
Firebase Hosting	Serves the zero-install web version of the app on a public HTTPS URL for desktop users and quick demos.
Firebase App Distribution	Delivers each new signed Android build straight to invited testers with an install link, no Play Store round-trip.
Secret Manager	Stores the transactional-email credentials that send MPs their first-time and recovered login details, kept out of source entirely.
Play Integrity API	Attests that phone-OTP requests come from a genuine, untampered app install, protecting the SMS pipeline from abuse.
Cloud IAM & ADC	Lets each function authenticate to Vertex AI and Translation as its own service identity, so there are no AI API keys anywhere in the codebase.

Maps use OpenStreetMap tiles over official Karnataka KGIS/KSRSAC boundary data – the only non-Google data layer, chosen for authoritative constituency, taluk, and ward geometry.

What ships in the app today.

Voice-first reporting

Speak a grievance in your own language; it's transcribed and shown back to edit before it's sent — built for citizens who don't type or read English comfortably.

Live demand map

The MP sees their real constituency outline with wards and taluks shaded by severity and flame-marked hotspots — where the need is, at a glance.

Ranked development works

Competing proposals are scored on demand, demographics, and infrastructure gap, so the agenda reflects the most people's need — not the loudest request.

One-click AI briefing

A branded, printable PDF with stats, ranked issues, and department-ready recommendations, written by Gemini from the live data.

Trending near you

Citizens see and back others' suggestions with "I support this," turning private frustration into visible, countable collective demand.

Trackable token receipts

Every submission returns a structured tracking ID a citizen can quote and follow — accountability from the first second.

Ten languages

Kannada, Hindi, Tamil, Telugu, Malayalam, Marathi, Bengali, Gujarati, Punjabi, and English — the whole UI, not just the input.

Self-service MP onboarding

An MP verifies a unique ID and email to receive credentials by mail, and can recover them the same way — no manual provisioning.

Runs anywhere

The same real-time product on Android and on the web, so a demo needs nothing but a link.

Designed around how people actually feel about their government.

Adoption is a psychology problem before it's a technology one.
Every interaction is built to lower a specific barrier.

FEAR → SAFETY

Anonymity and a receipt

People hesitate to report failures of the very authority they depend on. Optional anonymity removes the fear of reprisal; the instant token receipt removes the fear that it vanished into nothing.

INTIMIDATION → EASE

Voice over forms

A blank English form excludes the elderly and low-literacy citizens most affected by civic gaps. Speaking in your own language meets people where they are.

EFFORT → REWARD

A completed transaction

Submitting ends with a checkmark that draws in with a chime — the same "done" satisfaction as a payment app. The act feels finished and worthwhile, not dropped into a queue.

ABSTRACTION → BELONGING

This is your MP

The app names and pictures the exact person who represents you and the constituency you fall in. An abstract democracy becomes a concrete, personal relationship — and a collective "I support this" proves you're not alone.

Three stakeholders, one shared record of truth.

PRIMARY Citizens Anyone with a phone — including those who can't read a form or write in English — gains a low-friction, trackable, fear-free way to be counted between elections.	DECISION-MAKER The MP & office Each MP sees only their own constituency, with demand consolidated, hotspots mapped, and works pre-ranked — replacing gut feel and access-bias with evidence.	BENEFICIARY The wider system Planners, journalists, and researchers gain an objective, real-time picture of where public demand actually concentrates — data that simply didn't exist before.

— DEPLOYABLE & READY TO SCALE

Live today. Nationwide by design.

Why it's deployable right now:

- It's **already running** — installable Android app and a public web URL, on live Firebase infrastructure, not a mockup.
- It's built entirely on **fully-managed, serverless Google Cloud** — it auto-scales from one report to millions with no servers to run.
- It uses **official government geometry** (Karnataka KGIS/KSRSAC) for constituencies, taluks, and wards, so routing is accurate, not estimated.
- Costs scale with use: AI runs on the project's existing billing with **no separate balance** to exhaust.

How it scales beyond the pilot:

- The routing engine already covers **all 543 Lok Sabha constituencies**; the Karnataka pilot is a depth-first slice, not a ceiling.
- The ward/taluk model is **data-driven** — onboarding a new state means adding its boundary files, not rewriting code.
- The pipeline is **language-agnostic** by construction; adding a language is a translation config, not new engineering.
- Messaging-app intake (e.g. WhatsApp) drops in as another submission source feeding the **same** tokenized pipeline.

See it work, then try it yourself.

⚙️ UNDER ACTIVE DEVELOPMENT • WORKING PILOT

Prajadhwani is still being built, so the live app has a few known constraints. Watch a short walkthrough of each side, then sign in with the demo details below and explore every feature for real.

▶ Citizen walkthrough — video

▶ MP walkthrough — video

Before you start: turn off any app-blocker or battery/background restriction for the app on your phone, or Android may close it mid-use. The walkthrough videos show exactly how to do this.

FOR CITIZENS

Sign up as a citizen

1 On the citizen sign-up screen, skip Aadhaar extraction and choose **manual entry** instead.

2 Enter these details:

Full name	Saivikas PS
Pincode	561203
Location	Doddaballapur, Karnataka
Ward number	168

Tap **“Use my location”** and drop the pin in Karnataka — Doddaballapur, near Bengaluru.

3 Verify your phone number:

Mobile number	+91 90000 00001
OTP code	123456

4 Enter any age to continue.

5 You land on the home page — from here **every feature works**; explore freely.

Why Karnataka only: due to current memory limits, only Karnataka's data and boundary mapping is loaded, so keep the location inside Karnataka.

Note: phone-number sign-in has a minor known issue right now, so please use the test number above.

FOR MPS

Sign in as an MP

1 Open the **MP office** tab. Skip “first-time MP setup” and use the **normal sign-in**.

2 Enter the demo credentials:

Constituency ID	2927
Password	Mpg8xEQ9b9tx!7

This is the Chikkaballapur constituency account.

3 You land on the MP dashboard — **every feature works**, including the live demand map and the downloadable AI briefing. Explore freely.

Everything past sign-in is functional: constituency map with hotspots, ranked works, cluster themes, and the one-click PDF report.

— TRY IT NOW

Two links. No setup.

Anyone can open the web version instantly, or install the Android build directly — no Play Store, no tester invite required.

Zero-install · any device

Web app

Opens in any desktop or mobile browser — ideal for a quick look or a live demo.

Open web app →

`https://code-for-community-e2cf2.web.app`

Android · public download

Install the APK

Direct download, sharable with anyone. Enable "install from unknown sources" when prompted.

Download APK →

`firebasestorage.googleapis.com/.../public/prajadhwani-latest.apk`

To sign in as an MP for a demo, use the **MP office** tab. Phone OTP works instantly for the two registered test numbers; any real number now works too, following the app-attestation fix.

“The voice of the people is not a poll taken
once every five years. It is a signal, arriving
every day, finally heard.”
